Homework0

Takuto Yoshida

2023-01-24

1. Read in the nhefs.xlsx file from the EPI 289 course website. Show your log to demonstrate that the file was successfully assigned.

```
# Question1
install.packages("readxl", repos = "http://cran.us.r-project.org") # read excel file
## The downloaded binary packages are in
    /var/folders/01/yxgsk4rn7r9gh2ch_khv9cp40000gn/T//RtmpWZOJLM/downloaded_packages
library("readxl")
df <- read_excel("/Users/yoshidatakuto/Dropbox/HSPH/MPH-CLE/Spring/EPI289/Homework0/nhefs.xlsx")
  2. Sort the data set by the variable seqn. Print out the ID number, age, and sex for the first 10 observations.
```

```
# Question2
## Sorting the data
df[1:10, c("seqn", "age", "sex")]
## # A tibble: 10 x 3
##
       seqn
              age
```

```

9. Fit the same model from Question (8) using glm in R and compare your results.

```
# Question9
adj_linear_model_2 <- glm(wt71 ~ age + sex + race, data = df)

## Get the predicted values for the first 5 observations
predicted_values_2 <- predict(adj_linear_model_2, newdata = df[1:5,])

## Get the observed value for the first 5 observations
observed_values <- df$wt71[1:5]

## Print the observed and predicted values
cbind(Observed = observed_values, Predicted = predicted_values_2)</pre>
```

```
## Observed Predicted
## 1 79.04 82.33576
## 2 58.63 76.87137
## 3 56.81 69.49903
## 4 59.42 82.17154
## 5 87.09 76.84610
```

10. Using glm with family specified as binomial in R, fit a multivariate logistic regression model for the outcome asthma diagnosis in 1971 with age, sex, race, and usual physical activity status (var active) as the predictors. Print the predicted probabilities of asthma diagnosis for the individuals with the first 5 ID numbers.

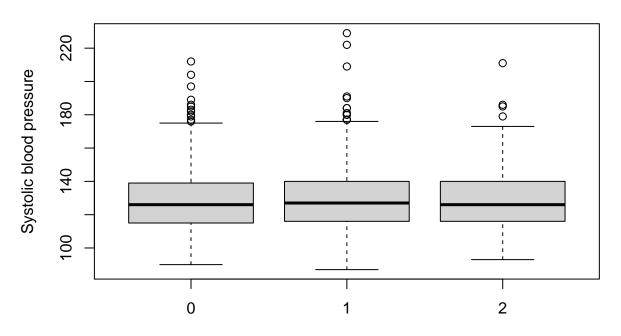

```
# Question10
## Fit the multivariable logistic regression model
df$asthma <- as.factor(df$asthma)
df$active <- as.factor(df$active)
adj_linear_model_3 <- glm(asthma ~ age + sex + race + active, data = df, family = binomial(link = 'logis')
## Get the predicted values for the first 5 observations
predicted_values_3 <- predict(adj_linear_model_3, newdata = df[1:5,], type = "response")
predicted_values_3</pre>
## 1 2 3 4 5
```

11. (Optional) Create a graph that plots systolic blood pressure on the Y-axis and usual physical activity status (var active) on the X-axis.

0.02287751 0.03464734 0.04262889 0.02952948 0.03570667

```
# Question 11
boxplot(sbp ~ active, data = df, xlab="Usual physical activity status", ylab="Systolic blood pressure",
```

Q11 Answer

Usual physical activity status
